

Peripheral Solar Pumps

INSTALLATION AND OPERATING INSTRUCTIONS

Before installation, you should carefully read this manual, and pay attention to safety cautions and instructions in this manual. Our factory is neither responsible for nor is reliable for paying compensation for personal injury, pump damage and other property losses caused by violation of safety cautions.

1. APPLICATIONS

1. It is applicable to household water supply, equipment support, small air-conditioning system, pipeline pressurization, garden watering, vegetable greenhouse watering, fish breeding and poultry raising, etc..

2. Transfer clean water and other non-corrosive liquids with low viscosity; do not transport inflammable, explosive, gasified liquids and liquids containing solid particles or fibers. The PH value should be within 6.5-8.5.

Remark:

This series of pump could be transformed into automatic water pump, which is realized through external automatic plant that is composed of pressure switch, pressure tank, etc. Function features of the automatic pump are as follows: when the power is on, turn on the water tap and the pump will start working automatically; when the water tap is turned off, the pump will stop working automatically. If a water tower is used along with the automatic pump, connect to the upper limit switch and the pump will start or stop working automatically with water level in the water tower.

Model Description & Technical Data

MODEL NO.	SYDC-QB1.5-15-12-180	SYDC-QB2.2-25-24-370
Description	QB SERIES 180W 12V HEAD AT 15M FLOW 1.5M ³ /H	QB SERIES 370W 24V HEAD AT 25M FLOW 2.2M ³ /H
PICTURE		
RECOMMEND SOLAR CONNECTION		
RECOMMEND BATTERY CONNECTION (series connection)	ONE BATTERY 12V bigger then 25A series connection	TWO BATTERY 12V bigger then 25A series connection

4. IMPLEMENTATION STANDARDS

IEC/EN 60335-1 Household and similar electrical appliances--safety Part 1:General requirements.
IEC/EN 60335-2-41 Household and similar electrical appliances--safety Part 2-41: Particular requirements for pump.
2006/95/EC Low voltage directive

5. SAFETY PRECAUTIONS

1. To ensure normal and safety operation of the electric pump, read manual carefully before use.

2. The electric pump should have reliable grounding to prevent short circuit; for safety, leakage protection switch should be equipped and be careful not to wet the power plug; socket should be connected in damp - proof area.

3. Do not touch the electric pump while working; do not wash, swim near working area or let livestock into the water to avoid accidents.

4. Avoid splashing pressured water to the electric pump as well as prevent the pump immersed by water.

5. Keep the pump in ventilation.

6. In case ambient temperature is lower than 4°C or the pump is not used for a long time, empty liquid the pipeline system to avoid ice cracking of the pump chamber. Do not operate the pump for a long time without water in it.

7. The pumped liquid maybe hot and under high pressure, before moving and demounting the bump, valves in both sides of the bump should be turned off first and then empty liquids in the pump and pipelines so as not to be scalded.

8. Do not transfer any inflammable, explosive or gasified liquids that beyond the stipulation.

9. Ensure the pump will not be accidentally turned on while installing and maintaining; if not used for a long time, cut off the power first and then turn off valves in inlet and outlet of the pump.

10. Power supply should be in accordance with the voltage stated in the nameplate.

If not used for a long time, put the pump in dry, ventilated and cool place under room temperature.

6. PRODUCT STRUCTURE

- | | |
|----------------------|--------------------|
| 1. Pump body | 10. Fan |
| 2. Impeller | 11. End plate |
| 3. Mechanical seal | 12. Cable holder |
| 4. Support | 13. Cord clip |
| 5. Water proof gland | 14. Capacitor |
| 6. Bearing | 15. Capacitor box |
| 7. Rotor | 16. Terminal board |
| 8. Spring washer | 17. Stator |
| 9. Fan cover | 18. Filling plug |

7. PIPE LINE INSTALLATION

This product should be installed and maintained by personnel who is proficient in this manual and has special qualifications. Installation and operation should be in accordance with local regulations and recognized operation standards. Install pipelines properly as stipulated in the manual and meanwhile conduct frost protection measures for the pipeline.

1. For pump installation, the inlet pipe should be as short as possible with the least turnings. The pump should be installed in ventilated and dry environment. It could be installed outside, provided having proper covering to prevent rain and wind.
2. For pipeline use, valves should be installed on inlet and outlet pipelines.

CORRECT INSTALLATION DIAGRAM

A. Installation precautions for inlet pipelines

1. While installing the electric pump, do not use too soft rubber tube for the inlet pipeline, avoiding to be sucked flat.
2. The foot valve should be vertically placed and installed 30cm from water bottom to avoid sucking in sands and stones (82);
3. Joints of the inlet pipelines should be sealed with the least elbows, no water can be sucked.
4. Diameter of the inlet pipe should be at least in accordance with that of the water inlet, so as to avoid too much water loss which will influence outlet performance.
5. Pay attention to drop of water level while using, the foot valve should not be above the water surface (81).
6. In case the inlet pipe is longer than 10m or its lifting height exceeds 4m, the pipe diameter should exceed diameter of water inlet of the pump.
7. Ensure the pumped will not be affected by pipeline pressures while installing the pipelines.
8. Filter should be installed in inlet pipelines so as to avoid solid particles to enter into the electric pump.

INCORRECT INSTALLATION DIAGRAM

B. Installation Precautions of the outlet pipeline

1. Pipe diameter of the outlet pipeline should be at least in accordance with that of the water outlet, so as to reduce its voltage drop, high flow rate and noise to the minimum.

8. SOLAR PANEL CONNECTION

Solar Water Pumps

Solar pumping systems work anywhere the sun shines. Pumping water is a sensible and effective use of solar electric power. During the hot months, when water requirements are highest, a solar pump will provide a reliable water source for a farm.

Asol-ar pumping system is available for almost all applications where an electric pump can be used. Because solar energy varies from one location to another, and over the course of a day, system design is important. Adequate water storage ensures that water is available whenever needed, and balances daily variations in water supply and demand. Thus a small pump only running when the sun shines, plus water storage, can often provide all that is required for water supply."

Installation Diagram

A. If the pump just need to work in sunshine, it can be directly connected to solar panels. There are two head wires with the pump, and you can directly connect them to the positive and negative electrodes of the solar panels.
NOTE: THE POSITIVE AND NEGATIVE ELECTRODES, PROHIBIT CONNECTED TO THE WRONG

B. If the pump also need to work during the night time, or even in cloudy and rainy day, you need battery.
NOTE: THE POSITIVE AND NEGATIVE ELECTRODES, PROHIBIT CONNECTED TO THE WRONG

6) Automatic device

6.1) While using the automatic pump, in case it still operates after turning off the water tap, lower down power cut-off pressure of the pressure switch on the premise of pipeline without leakage, namely, rotate the variable screw nut 11 in counterclockwise direction(-) to acquire lower closed pressure.

6.2) In case the pump is often enabled when the water tap is

turned off (sometimes it is turned on and sometimes it is turned off), check whether pipeline and the bottom valve have leakages and pressure vessel pressure is normal, eliminate timely if any.

6.3) In case the pressure switch is alternately turned on or turned off (frequent start) after turning on the water tap, increase power cut-off pressure of the pressure switch, namely, rotate the variable screw nut 1 in clockwise direction to acquire higher cut-in pressure.

4) In case the pump is halted for a long time, start it up again according to above diagram.

5) In summer or when the ambient temperature is high, pay attention to ventilation, avoid dew on electrical parts which will result in electrical faults.

6) In case the motor is hot or abnormal, cut off the power immediately and check faults according to the following table.

9. START UP AND MAINTENANCE

*Do not start up the pump before the pump chamber is filled with water.
Do not touch the electric pump unless its power has been cut off for at least 5 mins.
Do not dismount the pump body unless water in the pump chamber is emptied.*

9.1. Rotate the fan blade before start-up, check whether the pump rotation is flexible and then unscrew the water-filling plug, fill the pump chamber with clean water from the water injection hole, then tighten the plug screw after gas has been completely discharged. Set the valve in a smaller flow in start-up and adjust to the required flow after water discharging (working range is displayed on the nameplate).

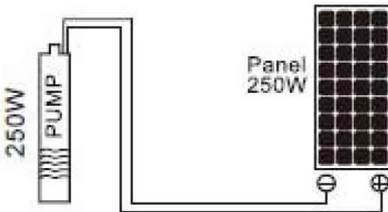

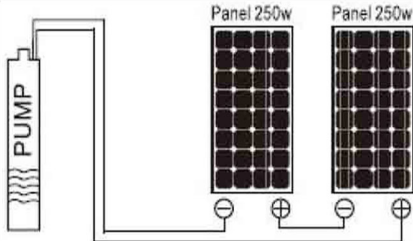

Attention:

1) In case no water is discharged after being started for more than 5 minutes with water filled, turn off the electric pump, re-fill water or check whether the inlet pipeline has leakages.

2) In case of any frost and ice damages, please open the drain plug to empty water in the pump chamber. When start up the pump again, open the drain plug, fill water and tighten it and then the pump is usable.

3) In case not use for a long time, water in the pump should be emptied. The pump body, impeller and support should be cleaned and coated with anticorrosive oil before they are put in a ventilated and dry place for use.
